# Declaration of AI Tool Usage

AIC211 – AI for Cybersecurity · Project Topic 10 · Team: Đoàn Hải Đăng, Chu Văn Tuấn Đạt, Lê Đức Cường, Pruvot Chales, Nguyễn Phúc Thịnh

**AI tool used.** Claude (Anthropic), through the claude.ai chat interface [add model version and the period of use]. No other AI tool was used: not ChatGPT, not GitHub Copilot, and no other large language model.

**Where Claude was used.**

| Area | What the AI did | What the team did |
|---|---|---|
| Understanding the task | Explained the Topic 10 requirements and proposed the scope: sentence-level, 15 tactics, multilabel | Chose the topic and accepted the scope [add any change the team made] |
| Code | Drafted the scripts 01–08, the notebook, README.md and requirements.txt: data extraction, preprocessing, group-aware split, baselines, DistilBERT fine-tuning, threshold tuning, final test, explanations, robustness test and web demo | Downloaded the data, ran the code on our own machines and on Google Colab, trained DistilBERT, and fixed environment problems |
| Analysis | Suggested the metrics, the leakage controls, the bootstrap intervals and the error analysis, and helped interpret results | Provided the real outputs of our runs and checked that the analysis matches them [add how the team checked] |
| Report | Drafted the final report in English and Vietnamese, following the course template, with its tables and charts | Reviewed and edited the text [add what the team changed or wrote itself] |

**What the AI computed itself.** Some numbers in the report, namely the bootstrap confidence intervals, the per-tactic confusion counts, the security-impact figures and the confidence-based review rule, were calculated by the AI from the prediction files produced by our own DistilBERT run. The AI also ran the baseline part of the pipeline in its own environment to cross-check our numbers. One sentence in the preprocessing slide is an illustrative example written by the AI and is labeled as such.

**Limits and verification.** AI output can contain mistakes. The team ran the code, compared the printed results with the report, and corrected the problems we found [add concrete examples, for example the split mismatch that was fixed]. The AI did not run the DistilBERT training or the Gradio demo itself; those parts were run by the team.

**Responsibility.** The team takes full responsibility for the content of this project and for academic integrity. Every member can explain the code, the method and the results for the steps they present. Chat history is kept as evidence of how the AI was used.
